

The pdfannex package

nocona71

Version 0.2.0

1 Overview

pdfannex includes PDF files as annexes using pdfpages. Each annex gets a hyperlink target, a PDF bookmark, an entry in an automatic list of annexes and a label usable in cross references. It works with pdfLaTeX, LuaLaTeX and XeLaTeX and does not depend on the document class.

Annex numbers and pages are stored in the .aux file, so run L^AT_EX twice; references show ?? on the first run.

2 Usage

```
\usepackage{pdfannex}
...
\listofannexes
\includeannex[label=cv,layout=footer-safe]{cv.pdf}{Curriculum vitae}
See \annexref{cv} on page \annexpageref{cv}.
```

`\includeannex[options]{file}{title}` includes all pages of *file* (or those selected by *pages*) as one annex.

`\NewAnnexSource{command}{scheme}` defines *command* like `\includeannex`, but its first mandatory argument is a reference served by an external resolver: `\NewAnnexSource{\includedoc}{docstore}` makes `\includedoc{42}{Title}` equal to `\includeannex{pdfannex://docstore/42}{Title}`. The package accepts any scheme name; the optional command-line tool finds the resolver program.

`\pdfannexsetup{options}` sets defaults for later annexes.

Prints the list of annexes. `\annexref{label}` and `\annexpageref{label}` give a link to the annex and its first page.

3 Page size and scaling

Annex pages keep the sheet size and orientation of the host document; pages are never rotated or stretched. Each source page is scaled uniformly to fit the sheet, and the aspect ratio is preserved.

Warning: `pdfpages` scales to fit, so source pages smaller than the host sheet (for example an A5 PDF in an A4 document) are *enlarged* to fill it, and larger pages are shrunk. Preventing enlargement is not supported in this version. Pages in the same PDF are fitted independently.

4 Options

label Label for `\annexref`.

pages Page range passed to `pdfpages` (default `-`).

nup Several source pages per sheet, passed to `pdfpages` (for example `2x1`); the annex page number and `\annexpageref` refer to its first sheet. Combining different files on one sheet is not supported.

layout `fullpage` (default), `footer-safe` (scaled down to leave room for the host footer) or `framed`.

margin, footer-space Custom margin and footer area; the page is scaled uniformly and shifted up. They override the preset scale of `layout`.

frame Boolean; draw a frame around each page (implied by `layout=framed`).

page-style Page style used on annex pages (default `plain`).

pagination inherit (default) uses the current page counter. `continue` first ends the current page and continues the page counter from the physical pages already output; use it with classes that reset the page counter, such as `scrlttr2` with several letters.

bookmark, list Boolean; add a bookmark or list entry (default `true`).

annex-name, heading Words used in bookmarks and list entries (`Annex`) and the list heading (`Annexes`).
